How It Works:

The caliper has **two jaws**:

The **outer jaws** are used to measure the outside dimensions of an object, like the width or diameter.

The **inner jaws** are used to measure inside dimensions, like the diameter of a hole.

There is also a **depth rod** that extends from the end to measure the depth of holes or recesses.

You slide the jaws open or closed to fit around the object you're measuring.

The **digital display** shows the measurement, making it easy to read and understand.
